

### Beebot Response:

I like the ideas provided in the YouTube videos for Beebot. It could definitely be used for students in lower elementary in various ways. I like the use of it for teaching the importance of following specific instructions and sequencing. I would put kids in pairs with a type of game board or map and tell students they have to create a treasure hunt. Certain spots on the map have to be visited in a certain order, but students choose the paths. The instructions created by student pairs will send the Beebot to the different locations on the map, eventually leading to the treasure chest. It shows students the versatility of technology, options available, and the importance of following specific instructions to reach an end goal.
