Visme, https://www.visme.co/

Visme is an online design tool that can be used to create presentations, visual posters, webinar materials, syllabus and lesson plans, worksheets, and much more! I would use Visme to create fun visual posters and presentations that go over some of the lessons we cover in class! Here is an example of a poster I made about the 4 seasons that I could print off and hang in my class and show my students!

YouTube, https://www.youtube.com/

YouTube is video-sharing platform that can range from educational videos to entertainment videos all on one site. Many families and students will already be familiar with YouTube so it would be an easy online tool to use in the classroom that wouldn't take much time to learn or adjust to. I could use YouTube to upload mini lessons and attach them to my website or link other users educational videos onto my website for students and parents to view and learn from. YouTube is a fantastic platform and I have personally learned math and other subjects thanks to watching peoples educational videos on the topics. I think this would be beneficial to any student who wants to watch videos over content gone over in class during their free time and if I linked it on my websites parents would not have to worry about the video being inappropriate as I would thoroughly check them before posting links to the videos. My example of using YouTube in the class would be for videos like this one, https://www.youtube.com/watch?v=tQASh8bbkUY, this video is a cute song about colors that will get stuck in students heads and help them remember the content! Videos like this can be shown in class to help engage students and help them learn the content in a fun and interactive

manner compared to lectures. I know I learned so much when my science teacher would put on Bill Nye from YouTube videos when I was in school because I absolutely loved him and his videos really helped me learn! YouTube and some of the videos on it can be very beneficial when you want to learn!

Quizizz, https://quizizz.com/

Quizizz is an online quiz maker that can be used to create quizzes, homework assignments or class activities. Quizizz also has a lesson section that is currently in the beta stage. Quizizz allows users to assign homework and even has a function to do live quizzes! Each quiz gives a certain amount of time that the creator can choose that the students will get to answer the question before it moves on to the next question. I would use Quizizz to create online homework assignments and quizzes over topics we are going over in class. Quizizz has one of the easiest layouts for quiz making I have ever used and I highly recommend this site! I could also create extra little quizzes that I can add to my website for extra learning materials that can be used at the child's home! Here is an example of a potential quiz or homework assignment I created over colors and rainbows! https://quizizz.com/admin/quiz/5fc749e19f68dc001b2c6052

Talking Points, https://talkingpts.org/

Talking Points is a communication platform for teachers and families. Talking points allows teachers to message parents but with a twist that emails or text messages typically don't have, Talking Points translates the messages into different languages as needed! Talking Points allows teachers to communicate with ALL of their students families even if there is a language

barrier! Talking Points is free and I would use this app in my classroom and try to get all of the students guardians abord to using it, I want to be able to communicate to all of my students families and this online tool would greatly help me achieve that goal! Talking Points is free and I definitely recommend this to all teachers and upcoming teachers! I do not have an example for this tool since it is a messenger/translator tool but I couldn't pass this one up! Building a strong relationship with my students families is a top priority so this app is a very important tool that I will be using in my future classrooms!
