### Homer

The latest version of Homer is 9.0.1, and the publisher/producer of Homer, is Homer. The Target audience is children 2-8 years old. This app is a Discovery Learning app.

This app includes things like reading, math, social emotional learning, creativity and thinking skills therefore it is very easily integrated into the curriculum. Is for the cost it is \$59.99 annually or \$9.99 monthly, after a 30-day free trial.

This app had the capability of being set up for up to four children with their own personal accounts to help keep track of their learning development. the appearance of this app was very appealing it was very colorful and easy for children to navigate. This app did not require adult supervision, and the parent/ teacher sections on this app where locked with codes that would require you to be able to read to access them, therefore limiting a child's ability to access those areas.

This app was very age appropriate and it could be adjusted too multiple different age and learning levels. This made it very convenient for setting it up for multiple children which would make this a great classroom asset. This app was colorful and creative and would have the ability to keep the attention of children and make learning fun for them. This app is great because it is easy to navigate for children it does not require adult supervision. This app can be compared to other apps like it such as Khan Academy kids they are very similar and the only major difference that I see between these apps is that Khan Academy is free, while you must pay for Homer. Because of this if I had to choose either Homer or Khan Academy kids, I would choose Khan Academy.
