Title: Splice

Version: 3.5.3

Publisher: GoPro, Inc

Type of Software: This is a movie creator and editor. It is a tool for students and teacher's alike

Target Audience: 4+ I agree with this target audience, because this app is very easy to navigate and learn. Children cannot access any inappropriate material, allowing it to be a fun app for children of all ages to explore and make fun or educational videos.

Curriculum(s): This app can be used to have students create digital stories, record speeches, or to showcase their learning. By having students create digital stories about their writings, they can use their creativity and make their writing come to life. If students are given an assignment to write and record speeches Splice would be a great tool for students to use. This is because they can record multiple videos and put them together. They can then edit them and add transitions. The teacher can use this to record students progress and show the parents at the end of the year.

Possible Environment(s) and why: The environments this would be best to use in would be a small group, teacher, and single user. Students can get together in groups and use Splice to make video projects and then present them to the class. This could also be used as a teacher tool. The teacher could use this to video students throughout the year and then make a small movie for students to see their child's project. This finally could be used in the single user environment. Students could work on their own to bring their creations to life.

Cost: Free and there were no in-app purchases

What is this Software: This app is a movie maker and editor. Students and teachers can use this app to express themselves. They can upload pictures, recordings, and clips off their camera roll, the internet, or GoPro. The user can create pretty much anything they want by making their own music and adding the images they want. In this software basic greys and blues are used to draw the eye to different parts of the screen.

Impression/How you would use in classroom: I was very impressed with this app because of two main features. The fact that you could upload pictures off multiple places and that you could create the music you wanted to go along with your movie. These two features make the app great for the classroom. The only downfall is that the screens are a little bland in that there is only blue and grey. Within the app there were premade questions. We found this to be a great resource, because these were frequently asked questions. Teachers can use this app to allow students to use their imagination and make what they want. Students would be given a small writing assignment and then use Splice to bring that assignment to life.

Does software pass: We find that this software does pass and is great for both students and teachers based on all the information given above.
