Title: Code Kart

Version: 3.0.1

Publisher: Edoki Academy

Target Audience: The publisher states that this app is for ages 0-5 and we both agree on that, but we also think that this app can be used for ages 6-9 because we believe children at that age will really enjoy and learn from this app.

Type of Software: Coding: This is a coding app because it allows the students to pick apart the runway for the cart to go and so it is teaching them how to decode things.

Curriculums: This app does fit into the curriculum because it teaches the students about coding and how to use coding to solve different problem, but in a fun way.

Cost: This app is free to download, but once you hit level 10, it won't let you go anymore, because it wants you to upgrade to the full version which is $2.99 and it will give you access to the other levels.

Describing the Software: Code Karts is an app that teaches children about coding and how to decode to solve problems. The app allows the students to decode go karts. There is a go kart at the starting line and the students will have to use the arrows on the side bar. The go kart will make it to the end of the finish line if the students use the right codes to get the kart safely to the finish line. If the students pick the wrong codes, the kart will crash, and they will have to start over. In each level, the go kart will be in a different position and the students will have to choose the right codes in order to get the kart to make it to the finish line.

Impressions of the Software: We both really like this app a lot. It allows the students to decode to solve problems in a fun way. The app is so fun that the students won't even realize they are coding, and the more they do it the better they will get and the better they will get at solving problems. The app had very exciting sounds and vibrant colors that we both think enhances the students, and we both plan on implementing this into our future classroom.

Pass: Yes!
