Title: Splice Video

Version: 4.1.4

Publisher: Bending Spoons Apps IVS

Target Audience: The publisher states that this app is for ages 4+, so there isn't really a specific age group, but we both think that this app is best for mid-level and high school instead of elementary students.

Type of Software: Tools: This is a tools app because it allows the students to make movies, videos, slide shows, or whatever they decide to make. They are able to choose the format of their video, add music, etc. They are able to crop pictures, edit their videos and add filters.

Curriculums: This app does fit into the curriculum because it teaches students about different tools, they can use to make a movie or a video. The students could use this to come up with a story and make a movie, or they could be presenting a specific project and have to make a video of all of the things they have found. This is a great app for students, and they get to learn visually.

Describing the Software: The Splice Video app is an app that allows you to make movies, videos, etc. It allows you to use different tools to edit your video.

Students are able to record and make a movie, or they can get images and put a slide show video together and present it to the class. Students could also use this software to tell stories to your classroom with a cool video, and you can mix it up and add filters, sounds, color, etc. This software would be great to use in upper

level classrooms so that they could have more fun with it, because we feel like elementary students would have a hard time trying to put a movie/video together.

Impressions of the Software: We both love this app. We see a lot of potential in this app, and we both think we could implement it into our future classrooms. We love how your able to edit your video and add all these different tools to it. You can add music, change the size, record, add filters, etc., and it can help students with certain projects.

Pass: Yes!
