

## Constellation Clips

This short “how to” video provides a quick and easy step-by-step instructional video to create indoor constellation maps. The video shows the students how to use a printed out constellation, scissors, and black construction paper to make a constellation map. After creating the map, the student can take their constellation into a dark room, with a flashlight, and project the constellation on the ceiling, walls, and floor. Not only will this enhance a students knowledge over different constellations, it could also help them distinguish different star patterns to look for in the night sky. Plus, there could be information added to the star maps provided on the website. Examples include; their location in the sky, the meaning behind their name, or the shape that they are supposed to form.
