inQRedible

Version: 2.0.2

Publisher: Emir Canpolat

Target Audience: The app says for ages 4 and up. We think this would be most beneficial in a higher age classroom, depending on what the teacher is using it for. Students will just need a device that has a camera to scan QR codes.

Curriculum: This can be used in all subjects. It is not designed specifically for one. A good way to integrate this app is by putting a website or assignment on a QR code and having the students scan the code on their device to complete the assignment.

Cost: The app is free to download. There is not a paid version or an upgraded version. However, you can remove the adds in-app for $0.99.

Description of Software: This software can be used to create or scan QR codes. The options of QR links are website URL, email address, phone number, text message, GEO location, Facebook profile, Twitter profile, Instagram Profile, and LinkedIn profile. You can choose any of these options to link to a QR code if you

are generating one. You can save multiple codes for later after making them. Users can also name their QR code.

Impressions of Software: We thought this software was very easy to use and navigate. Everything was labeled with tabs and took you directly to the source. It was very easy to create your own code and share it with others. It did not crash or glitch.

Does it pass? Yes.
