

iMovie - Story Board

Kori Tapp

- **Habitats Title**
- **Aquatic** - Aquatic habitats are all around the world. They are habitats that are completely dominated by water. Aquatic habitats are split up into two main groups: freshwater and saltwater.
- **Freshwater** - Freshwater has low levels of salt, less than 1 percent. Freshwater habitats include rivers, ponds, lakes, streams, swamps, etc. There are a bunch of different types of fish that live in freshwater, trout, salmon, bass, and many more.
- **Saltwater** - Saltwater has higher levels of salt, more than 1 percent. Saltwater habitats include oceans, seas and coral reefs. There are a bunch of different types of fish that live in saltwater, sharks, whales, manta ray, etc.
- **Desert** - The desert is a place where there is very little rainfall and because of this, very little vegetation. It is hot, dry and has less than 25cm annual average precipitation. There are a bunch of different animals that live in the desert. There are a bunch of different kinds of lizards, snakes, Camels, etc.
- **Rainforest** - The rainforest is very warm and moist with a lot of vegetation. The rainforest is very dense and constantly has heavy rainfall. Chimpanzees, tigers, elephant, monkeys, bats and toucans all live here.
- **Forest** - Most of you are probably more familiar with the forest habitat. A forest is simply a large area covered predominantly with trees and undergrowth. Bears, wolves, deer, turkey, eagles, squirrels and many more animals live here!
- **Grasslands** - A grassland is a large open area covered with grass. Grasslands are normally between a forest and a desert. Soil runs deep here and is very fertile. Animals such as bison, elephants, prairie dogs all live here.
- **Tundra** - The tundra is a cold and dry region with no trees. The ground is primarily frozen all year round. Animals that live here include polar bears, arctic fox, snowy owl, caribou, grizzly bears, etc.
- **Habitats**
