

## Mini-Lesson 4

### Fourth Grade

#### VR viewer (Titans of Space) and Smithsonian Planetarium Projector

Either individual students (VR viewer) or Whole Class (Projector)

These “toys” can help students learn about the layout of our solar system, as well as classification of heavenly objects. The Titans of Space game gives students tasks and goals while also educating them on the parameters set forth to classify planets, moons, comets, and asteroids. The VR set up of this game makes it interactive and very engaging. The Smithsonian Planetarium Projector is a great way to show the spacial relationship of one planet to another in the night sky, giving students a glimpse of why we see stars the way that we do and strengthening their perception of perception.
