I used the program called iMovie. I figured this would be the most logical one to use only because I am confident with my skills on this particular application. I have been using it for classes the last few months.

I will more than likely be using iMovie again just because of the simplicity it maintained and because how convenient it is that it is already on my MacBook.

I did like the software a lot, but one thing I would like to see differently is the way to get images onto the movie. It was so difficult to get accomplished and once I figured out how to do it, it ended up being an extremely long process.

Other Ways to Use Video in the Class
1. Making class movie
2. Using videos projected onto the board
    Get up and move type videos to encourage movement
3. Relaxation techniques
4. Lesson enhancement to increase thinking and raise questions

I think incorporating technology and things like video into the classroom is a great idea. Say your class makes a class video and included pictures from the previous school year. You could make copies and sell them to the parents as a way to earn money for the school. There are many benefits of doing this and the list of benefits could go on and on.
