

Night Sky Evaluation

Nate Tiner

Night Sky is a discovery learning application that can be accessed on an iPad/Apple device. This application would be great for any science and astronomy class. This application lets the users see where certain planets, stars, and satellites are at certain times of the day depending on your current location. This application is free to download, although it makes you either purchase a monthly or annual subscription. It is \$4.99 monthly, and \$29.99 annually. There is also a month-long free trial if you choose monthly. This would be a great tool for a science class, and I would want it to be utilized in my class, not only does it help you see where certain things are to plan star-parties accordingly, it gives you a lot of information about planets, stars and satellites as well. It is a good tool to let students discover things on their own, and I would allow students to spend time on this app. I would have students use this app to potentially prepare a report on a certain planet, star, etc. and explain some information about it and all that fun astronomical stuff. This is a really interesting app and I believe it will motivate students to learn and learn more.
