

Evaluating Apps

- **Title:** Nasa Visualization Explorer
- **Version:** Only
- **Producer:** Nasa
- **Target Audience:** Everyone
- **Types of Software:** Discovery Learning (you cannot get this on anything else, unless you are doing just Earth, then Google Earth is where it's at)
- **Curriculum:** Science
- **Cost:** Free
- **Description:**

When you first open the app, your eyes are caught by the colorful real life video clips from outer space. The ideas are tied in with a caption based on the picture and giving a well thought description. This app has 100% accurate and up to date, new every week, information on space.
- **Impressions:**

This app is exactly what we were hoping for. We like that you can view videos about real time space happenings. The only class you could tie this into would be science during the lessons of spaces but all of this information on the app is probably not in every textbook. Also, you can't get this anywhere else, and know it is accurate. You could assign each student a video to watch, sum up, and let the student teach it to the class. Reading information from a book is not as memorable and exciting like looking stuff up on this website. A downside to the app is that it took a long time to load.
