

- **Title:** Total Recall
- **Version:** Version 5.0
- **Publisher:** Zyense
- **Target Audience:** The age rating on the app store say it's for ages 4+ and while we don't think 4-7 year old students would really be able to use it, we do think it would be appropriate for 8+ year old students.
- **Type:** We would say this app type is a Tool. We think that this is a tool because it does not come with information that needs to be learned. The students would create their own mind maps with this app after learning something in order to demonstrate what they have learned.
- **Curriculum:** This could be used for a variety of different curriculum areas. The students could create mind maps to compare/contrast books, science topics, and even some writing topics.
- **Cost:** This app was free to download and use with full access.
- **Description of the software:**  
 This app is used to aid in learning by allowing students to make their own mind maps to show what they have learned. When you click on the app, it opens to a screen with a mind map that gives you all the instructions you need to use the app. The instructions are color coded. There are buttons at the bottom that don't really make sense until you play around with the app and get used to it. In the top left corner, there is a button that says "Mind maps" that you can click on where it shows you all the mind maps you have created and you can also hit the plus sign to create your own mind map. From there the screen will open on to a blank screen where students can start creating their mind map.

- **Impressions:**

This app is really bland with no bells and whistles; however, it does get the job done. Compared to Inspiration, it does not have as much to offer and it's also a little bit more complicated to use in some ways. We would use this app in the classroom, but it is good to note that there are other and better options.
