InQRedible

Version: 2.0.2

Publisher: Emir Canpolat

Target Audience: The app says for ages 4 and up. We think this would be most beneficial in a higher age classroom.

Curriculum: This can be used in all subjects. It is not designed specifically for one. A decent method to coordinate this application is by putting a site or task on a QR code and having the students scan the code on their ipad to finish the task.

Cost: The app is free to download. However, you can remove the adds in-app for $0.99.

Description of Software: This software can be used to create or scan QR codes. The options of QR links are website URL, email address, phone number, text message, GEO location, Facebook profile, Twitter profile, Instagram Profile, and LinkedIn profile. You can choose any of these options to link to a QR code if you are generating one. You can save multiple codes for later after making them. Users can also name their QR code.

Impressions of Software: This app was very straightforward and easy to use. Everything was labeled and took you directly to the source. It was also very easy to create our own code and share it with others.

Does it pass? Yes.
