

5th Grade Science

This mini lesson is for my 5th grade science class.

Students will explore 5 of the major body systems. This will be the muscular, skeletal, nervous, circulatory, digestive, and respiratory system.

Using the 3D anatomy app on their iPads, students will explore each system. They will take observations and notice where in the body that specific system is relevant to. As a class we will talk about each system and its purpose as they view it on their iPads. Students will then compete in a Kahoot game that ask questions that are specific to a body system. An example question can be, “ What system is the stomach in?” This can allow students to test their skills in a friendly and competitive way.
